SUMMARY

The Global Work-Injury Policy Database (GWIP) provides data on the introduction and development of work-injury policy in 186 independent nation states. Work-injury policies are also historically known as “workmen’s compensation” and sometimes “accident insurance”. This paper provides the codebook for the GWIP. Several aspects of this research are confounded by terminology, therefore we provide theoretical definitions and justifications of coding decisions in addition to the hard codes. This document accompanies the first public release of the data, gwip_v1.csv (Breznau and Lanver 2020), but also provides codebook materials for planned future releases.

The data are available via Harvard Dataverse <https://doi.org/doi:10.7910/DVN/IVKYIE>

1. BASIC INFORMATION

We generated these data as part of a larger collaborative research center located at the University of Bremen focusing on the history of social security programs and the welfare state around the globe². The data start with the development of the first national work-injury laws and the development of nation states as geo-political sovereign units starting around the mid-1800s.

1.1 Unit of Analysis: Nation State

Although many social welfare policies were made at the local and supranational levels, the nation state is the container that human society as a whole currently accepts as the highest order of sovereignty and thus policy-making power. Therefore, it is the unit of analysis in these data. Interestingly, there is no autonomous nation state on Earth that did not erect some form of welfare state policies at some point between the mid-1800s and early 2000s.

The development of the nation state in the form coded in these data arose as part of the shift from agricultural to industrial forms of work. In this process, events took place leading workers to obtain citizenship and social rights. This happened at different times in different places and to different degrees, but in general it represents a dramatic change in the history of human social organization. Whereas before, laborers – peasants, serfs, servants and etc. – had few if any rights, and were mostly dependent on a paternalistic or lord-vassal type relationship to secure their welfare and well-being. Except for the special case of soldiers, the ‘working masses’ had almost had no protections against social risks save charities. In some skilled occupations, workers formed their own collective risk pooling as members of guilds, but this covered only a fraction of the population. The first instance of large-scale worker risk pooling came via national legislation.

The nation state emerged as the main sovereign container of societies around the same time as workers were obtaining new rights in societies. Thus, the genesis of worker social rights is coterminous with the codification of nation states. It appears that without workers’ having some degree of social rights, a ‘nation’ cannot exist. The counterfactual logic here is that the workers are not part of the nation without social rights; in other words, neither do they have nationally granted entitlements nor are they likely to feel a part of a society that offers them little or nothing. When workers gained political and eventually social rights they were now part of a centralized system of risk-pooling. These systems today achieve a basic level of security and welfare for workers in many societies around the globe as of 2020. The power of nations resides in their workers’ allegiance to that nation in addition to the nation’s economic and political resources.

The strategy of enlisting allegiance to the nation for workers is similar to that of recruiting soldiers to fight for the nation. By offering the opportunity for benefits on top of wages, such as family compensation in the event of death, soldiers were more willing to fight for the nation. This phenomenon extends to workers who are likely more productive and cooperative when they feel an allegiance to a nation, or feel that the state is providing them with risk protections and improving their welfare.

2 Carina Schmitt, Herbert Obinger and Laura Seelkopf, “A02 Constituting the Welfare State in a Global Perspective. Determinants of Social Security Programmes” at the Collaborative Research Center (SFB 1342), University of Bremen (‘CRC’).

Given the goal of measuring the introduction of work-injury from a global perspective we selected all possible nation states and quasi-nation states. At first we focused on those with a population over 500,000; however, we are adding those with less over time. Release v1.0 contains 186, but we hope to add all remaining small countries in future iterations. The main criterion for selection is sovereignty. Thus, our target population are all independent nation states at the time of writing this. The caveat is that we include previous versions or sub-sections of those states. For example, the countries that comprise the former Yugoslavia have legal codes that refer to Yugoslavian law in some cases. Sovereignty operates somewhat on a sliding scale, so we include “territories” that maintain mostly full self-rule even if they have a federal state-like status or the land on which they are sovereign is not technically owned by their nation (e.g., Puerto Rico, Guiana and Taiwan). We refer to all of them as “nation states” for the sake of simplicity.

1.2 Data Coverage: 1838-2020

These data only offer a sliver of the whole story of work-injury policy. Like any coding scheme they require defining a starting point, and here this point could be understood in a number of different ways. The first national work-injury laws we are aware of are in Germany (1838), France (1852) and Austria (1854), but these only covered specific occupational segments, mostly mining and railroad construction. The first known system legally designed for all blue-collar industrial workers in an entire nation state was the introduction of German social insurance in 1884, even though this law took many years and adjustments before it covered all workers. Most scholars mark this as the genesis of the welfare state. However, there is a clear path dependency of earlier laws with later laws, as social insurance follows a kind of evolutionary process from early working conditions and wage laws, to certain segments covered, to full blown social insurance (Abbott and DeViney 1992; Flora and Alber 2009). Thus, our timespan starts in the pre-work-injury phase with the 1838 German law and spans through 2019. The idea of a pre-phase is critical to the understanding of the development of work-injury law. The forms of labor, how they were organized, the extent of petty bourgeoisie, the wealth of a society, the strength and forms of labor movements, urbanization, wars and so many factors played a role in shaping how and when work-injury policy and other welfare state policies came into being. For whatever myriad reasons, 53% (100 out of 186) of nation states’ first work-injury laws were formed in pre-nation state times and then carried over through national formation, for example as colonies, members of the Soviet Union or kingdoms that would later become nation states.

1.3 Definitions of “Work-Injury” Laws and Relevant Terminology

Here we focus only on legal forms, thus it is possible for a country to have a law on paper that covers all workers, but in practice to cover none of them. Future iterations of these data will include variables related to coverage and effectiveness of policies.

First law. The year a law was passed. This does not necessarily mean the year the law comes into force and says nothing about how successfully implemented the law was. If there is no year set for implementation of the law written in the law or made simultaneously by decree, then we do not consider it a first law. To be a “first” law, the law must be the first instance of our object of inquiry and it must apply to an entire country or a substantial portion thereof. Further details are available under “First Work-Injury Law” in Section 2.1

Employer liability. This is the earliest and crudest form of work-injury protection. These laws deem that employers are responsible for compensating workers for their injuries sustained while at work. The laws sometimes prescribe schedules of specific payments per injury type and other times are vague in terms of amounts or durations. The key difference between these laws and risk-pooling laws is that the burden of proof is on the worker. Under employer liability, the worker must go to court or file a claim with the appropriate administration to obtain compensation and there is no agency or fund with capital at hand to provide such compensation. Court proceedings often proved to be insurmountable challenges to workers due to their costs or legal jargon and paperwork. Employer liability laws were not much improvement over civil or common laws that specified general fault compensation. What was new with these laws was that they specifically targeted workers and usually added some kind of schedule or baseline conditions. Although they did not do much in practice to alleviate the risk of work-injury, they are important because they appear to be ‘stepping stones’ in the path dependent development of risk-pooling and social insurance.

Risk-pooling. This is the underlying concept of a welfare state. The burden of a social risk such as work-injury, in addition to aging, health, unemployment and family formation, is shared across individuals and various labor market actors – usually workers, firms and the state. In other words, society takes on the burden of risks that face all individuals, or all individuals in a certain segment of society. Having an employer liability law that demands compensation is not risk-pooling as the fault falls onto the employer and the burden of proof often on the worker, and the employer may or may not have a security or insurance system in place to safeguard against this fault; or may fight to prove not being at fault in court. Therefore, risk-pooling means that some kind of fund or insurance system is set up to pool resources from the many to allocate them to the few when they fall victim to social risks.

Social insurance. This is when insurance for workers is mandatory and regulated by the state. Usually this term refers to having all basic social risks covered; here we use it only in the narrow form referencing work-injury. The worker is entitled to compensation for work-injury unless otherwise proven, i.e., the burden of proof that the worker is not entitled to compensation is on the employer or insurance company. This is a no fault concept, that relieves the employee and employer from seeking compensation or legal action. Insurance means that a firm, organization or branch of the state collects premiums and distributes funds. It might be organized publicly or privately and there may be many insurance providers or only one. When workers and employers have no choice, but must have or provide insurance, then it fits the definition of social insurance.

Blue-collar workers. These are defined as industrial workers. They work in a production process involving mechanization. They are mostly manual laborers and machine operators. They vary from entirely unskilled through highly skilled workers. They are usually employed in private industry but may be employed by the state in cases where the state runs industries such as railroads. This class excludes agricultural and domestic workers, so long as they are not working with mechanized tools regularly.

Civil servants. These are bureaucratic and elected employees of the state. These exclude state run industries’ blue-collar workers and exclude any form of manual laborer.

1.4 Pre-Work-Injury National Policies

In addition to voluntary insurance schemes or those set up among guilds and employee associations, work-injury law evolved in a larger progression of laws to protect workers. In many nation states laws against child labor, regulation of the materials that workers worked

with (such as phosphorous), laws preventing or protecting female workers and providing the right to organize often came before or during the passage of work-injury laws. There was a massive global movement taking place of workers, in particular in industrialized nation states and sectors such as mining and matchstick making. Much of this was fueled by the Communist movement, but took on a variety of formats. Therefore, we are careful not to argue that our “first law” codes the absolute inception of worker protection against work-injury, as this arguably goes back much further.

2. VARIABLES

2.1 Variables in v1.0

In the *following* we list each substantive variable with a title (e.g., “Year of National Independence” and a variable label that users will find in the datafile (e.g., “*independence*”). The variable labels refer to the headers of the downloaded dataset. The sources for our coding are listed by country in the Appendix.

Empty cells indicate missing data. It means that there is no law according to our research, as of 08-Sep-2020.

Country Code

variable label: *cow_code*

These are the codes used by the Correlates of War (CoW) Project (<https://correlatesofwar.org/>) to identify countries. They are also consistent with the CRC’s internal designations. They modify or update the original CoW codes in the following ways:

- » Puerto Rico: gets its own code of 6.
- » Serbia: is coded 345 and includes all prior versions of Serbia, Montenegro and Yugoslavia for practical reasons.

Country Name

variable label: *country_name*

The current English name of the country.

Year of National Independence

variable label: *independence*

This variable gives information on the year a nation state becomes independent whether this arises out of association or end of colonial rule. If there were periods where the country lost independence but returned to its present or similar form (world wars or temporary annexation), then this code reflects the first instance except for cases of prolonged colonization, and having no work-injury laws prior to that colonization, for example Morocco is coded independent only after the long period of French colonization. This variable mostly follows recognition by the UN but deviates in some cases for countries that existed prior to the formation of the UN.

First Work-Injury Law

variable label: *labor_workinjury_firstlaw*

The year of introduction of the first law of any kind. It is the year the law is passed, not the moment it comes into force, so long as a timing of the law coming into force is written in the law or decided upon prior to its passing. For example, in Gambia their first written law had no time of implementation specified, so this does not count as a first law in our coding. Any law covering occupational segments should be coded, ideally it should apply to the entire country but geographic exceptions may occur as with federal systems and nation states with shifting boundaries. The first law is only coded if it is a notable extension of common or civil law. This means it has special provisions through which workers get due process, insurance or some other form of claims beyond an abstract principle of employer

liability that is generally unenforceable, for example institutionalized ‘forma pauperis’ or legal requirement to report all accidents to authorities.

A ‘first law’ covers industrial workers in some way. Thus, a first law must include segments other than civil servants, military or seamen. However, a first law is coded if it covers industrial workers working for the federal government, for example the blue-collar railroad workers in the United States. In cases of colonialism, colonial laws count as first laws. The first law should apply to the same geographic territory as it was at the time of the law as exists today, with small exceptions for shifts in official borders, for example Poland has ever shifting borders prior to WWII. Exceptions are made for cases where societies were one and then split due to the Cold War such as Korea, where the first law is the same law from the pre-Cold War single Korea for both North and South Korea of present day.

First Work-Injury Law according to SSPW

variable label: *labor_workinjury_firstlaw_sspw*

Taken from the SSPW’s 2017 country-specific html files using a text mining routine.

Until now, most scholars obtained data on work-injury introduction from the SSPW (Social Security Programs Throughout the World Data from the U.S. Social Security Administration). In our investigation of each country we often find different years than what is in the SSPW data. We include the SSPW data as of 2017 here for user’s reference as a variable. We do not argue that the SSPW is incorrect. They simply do not have a strict coding scheme as reported in an email exchange of October, 2016. We tried here to follow stricter coding guidelines and as a result have removed some theoretically impossible values in the SSPW, such as Poland’s first law in 1883, which appears to be recorded from the ILO’s 1935 *Report on Social Insurance*. In this ILO report, the 1883 code refers to the same law as Germany’s 1884 code, so the year is one year off, and the law covered only a fraction of Poland at that time so this does not suffice to be Poland’s first law according to our coding scheme.

First Work-Injury Risk-Pooling Law

variable label: *labor_workinjury_firstins*

This is the year of the first law providing insurance against work-related injury. “Insurance” here refers to the common definition, not the legal definition, as providing some form of shared protection against risk. That is why we refer to this as “risk-pooling” not “insurance” in the variable name. This variable indicates the first instance of mandatory social risk pooling. A provident fund, for example, counts as risk-pooling because workers have a shared pool of resources to protect them in case of an accident; again this is only by law and says nothing about the effectiveness or implementation of the law. Simply having a law requiring employer liability is not risk-pooling in our definition, because there is no insurance (fund, insurance policy, etc.) backing up the legal liability. If the first law of any form in a country was a risk-pooling law, then this variable is identical to *labor_workinjury_firstlaw*. If only a single occupation is covered but the state makes insurance mandatory for the entire single occupation (e.g., railroad workers or miners), then this would also count as the first risk-pooling law.

First Work-Injury Provident Fund

variable label: *labor_workinjury_first_fund*

First instance of risk pooling as a provident fund. It is missing if the country went directly from no law or employer liability without a fund to social insurance. Coding rules otherwise follow *labor_workinjury_firstins*. Provident fund means that paying money into a centralized fund is mandatory. This fund has the purpose of paying compensation. These funds vary greatly in nature, from occupation and industry specific to one fund for the entire workforce. Also, the amount contained in these funds, how much employees pay in, and what the fund managers do with the fund such as investing it or not also varies. For example, we code Uruguay's 1920 law as the first instance of a 'provident fund' because employers must pay in to a temporary fund in the event of an accident, and then after the claim is made the worker either gets the money or the employer is found to be not liable and gets the money returned (ILO LS 1920, Uruguay Workmen's Compensation, paragraph 47), a kind of mandatory 'pay-as-you-go' fund for the employer.

First Work-Injury Social Insurance Law

variable label: *labor_workinjury_first_socins*

First instance of social insurance for any blue-collar worker segment as defined in *labor_workinjury_firstins*. It must be mandatory that employees get private or associational firm insurance policies, or the government itself is the insurer. The key difference in social insurance as a form of risk-pooling is that fault is no longer on the burden of the employee. The employee is automatically entitled to accident compensation unless otherwise disproven by the insurer or other interested party - this shifts fault away from the employee by default.

First Work-Injury National Law

variable label: *labor_workinjury_firstnat*

The year of the first law when the country exists as an independent political entity. Many first laws were implemented under colonial or foreign rule. If the law was simply carried over from a previous law before independence then the year is identical to the year of independence. In cases where the first national law is passed within 2 years prior to independence, we code the year of the passing of the law rather than the year of independence and code *labor_workinjury_firstnat_carriedover* = "no", as in Grenada, Bulgaria, Iceland, Benin, Cameroon and Samoa.

First Work-Injury National Law Carried Over

variable label: *labor_workinjury_firstnat_carriedover*

This variable indicates, whether a law from colonial, foreign or imperial rule is carried over after independence. The exceptions are states that became nation states and carried the law over and did not have a geopolitical change (i.e., boundaries stayed the same); for these cases the first national law could come while not a fully autonomous nation state (e.g., Austria in 1852, but not Prussia in 1838 because Prussia did not become a nation state after being part of the German Empire).

First Work-Injury Law: Program Type

variable label: *labor_workinjury_firstlaw_programtype*

The program type of a work-injury law can either be "Risk-Pooling", meaning that there is some kind of mandatory risk pooling or "Employer liability" meaning that there is no

involvement of the state in financing and risk pooling, only an obligation for the employers to compensate in the case of work accidents. In this version of the variable, “Risk-Pooling” refers to either provident funds set up by the state or made mandatory by the state or actual social insurance with a private or state carrier (as with the coding of *labor_workinjury_firstins*). “Employer liability” is not the same as common or civil law codes that assign fault in case of injury. “Employer liability” means that there is a specific law targeting employers in industrial accidents and deaths as something more than basic common and civil codes. This is a variable constructed from a combination of *labor_workinjury_firstlaw*, *labor_workinjury_first_fund*, and *labor_workinjury_first_socins*.

First Work-Injury Full Coverage Law: Blue-Collar Workers variable label: *labor_workinjury_firstlaw_bluecollar_fullcoverage*

This is the year of full coverage for all blue-collar groups: manual labor; excluding agriculture and domestic workers. “All” means at least two-thirds, or all the major sectors of industry; exceptions should not be occupation or industry-specific. We code this as covering “all” as long as all enterprises with at least 5 or more employees are covered. This was a somewhat inferential undertaking because data were not always available. We will refine these measures over time and have taken notes by country (see Appendix). Note that coverage can be “full” in this variable, even if certain groups are excluded like women, ethnic or religious groups. We use the definition of a worker at the time of the passing of the law in that country. The logic is that the labor market was segmented, and citizenship was hierarchical in the early stages of work-injury law. Many groups were excluded as ‘second class citizens’ by law, thus there is no chance for them to be covered. Does not include prisoners or detainees; does not include ‘casual workers’. This variable only accounts for *de jure* coverage. As a “first law” the coding otherwise follows *labor_workinjury_firstnat*. In future iterations we will code the types of blue-collar full coverage laws. De facto coverage and measures of which groups were covered by each law that we code are planned for later versions. Also, first year of full-coverage of social insurance is planned for later versions.

2.2. Variables planned for future versions

2.2.1 GENERAL

labor_workinjury_generosity

Following the coding of the Comparative Welfare Entitlements Database 2 (Scruggs and Allan 2006) and the concept of “decommodification” made popular by Esping-Andersen, we will code the replacement rate for work-injury for each country.

labor_workinjury_socins_fullcoverage

The year of the first law for countries that enact universal work-injury coverage as social insurance - defined by *labor_workinjury_first_socins* but applying to at least 80% of the work force. The same will be done for blue-collar workers - defined by *labor_workinjury_firstlaw*.

labor_free_native

The year that all native born workers in a colonial setting are free to sell their labor. This means that slavery, servitude and any other forms of legal forced work without pay are abolished.

labor_workinjury_firstlaw_benefit_cash

Coded “Yes” if cash benefits, normally either in the form of wage replacement or a lump sum, are granted with the first law. So far all cases are “Yes” therefore we may drop this variable from our plans.

labor_workinjury_firstlaw_benefit_inkind_health

If there are health services, most commonly provisions that health insurance covers but are paid for or recouped from employers rather than insurers, then this is coded “Yes”. This variable will be useful in future research to link health systems to work-injury and welfare state systems more generally.

labor_workinjury_firstlaw_benefit_inkind_other

If there are other services, such as job-related amenities or contract provisions/extensions this is coded “Yes”. In all cases “funeral services” are at least partly covered in case of death, thus we exclude funeral services from this variable.

labor_workinjury_firstlaw_duration

This is coded in months. It codes the maximum duration of sick pay for standard sickness or injury (i.e., the cash benefit). There are many exceptions and conditions depending on the type of injury. Our goal is to code a common injury such as a broken bone, physical damage or poisoning. Also note that if work-related permanent disability puts the worker into the pension system, this is outside the scope of this law and is part of the pension law, not counted here.

labor_workinjury_firstlaw_benefit_family

Coded “Yes” if the families get any cash or in-kind benefits in the case of permanent disability or death.

labor_workinjury_firstlaw_groupdiff

Coded “Yes” if there are any group-based differences in the application of the first law to workers based on group membership whether declared, imposed or inherent, for example race, ethnicity, migration status or religion. There must be a difference in benefit levels or certain groups excluded. This variable does not include individuals outside of the labor market consistent with the *labor_workinjury_firstlaw* variable. Thus, slaves and those not legally allowed to work do not count.

labor_workinjury_firstlaw_genddiff

Coded “Yes” if women were not covered by the first law, or if women received less than men in any way.

labor_workinjury_firstlaw_details

This is a string variable (open-ended) that gives details on the law, e.g., the *labor_workinjury_firstlaw_benefit_inkind_other* variable or *labor_workinjury_firstlaw_groupdiff*.

2.2.1 OCCUPATIONAL GROUPS

labor_workinjury_firstlaw_civilservants

The first law for white-collar employees of the nation state. This might be only certain segments of the white-collar occupations such as legislators or judges.

labor_workinjury_firstlaw_civilservants_coverage

This variable = "all" if *labor_workinjury_firstlaw_civilservants* = *labor_workinjury_firstlaw_civilservants_fullcoverage*. Otherwise it lists the occupations covered by the first law.

labor_workinjury_firstlaw_civilservants_fullcoverage

This is the year that all segments of the civil servant occupations are covered. This means all white-collar jobs employed directly under contract with the nation state.

labor_workinjury_firstlaw_military

In many cases soldiers are some of the first 'workers' to receive work-injury protection. This is the first year that any segments of the military are covered. It may be earlier than *labor_workinjury_firstlaw*, because we do not consider soldiers as industrial or blue-collar workers. However, this variable is important in the path dependent development of work-injury law and welfare states.

labor_workinjury_firstlaw_military_coverage

This variable = "all" if *labor_workinjury_firstlaw_military* = *labor_workinjury_firstlaw_military_fullcoverage*. Otherwise it lists the occupations covered. "All" are considered covered by the first law if it covers the soldiers and the civil servant law covers the officers. Open-ended string variable.

labor_workinjury_firstlaw_military_fullcoverage

First year that all military workers are covered.

labor_workinjury_firstlaw_whitecollar

First year that any law is introduced to cover white-collar workers, e.g., clerks or managers, plus the same other coding rules for *labor_workinjury_firstlaw*. Excludes military, self-employed and civil servants.

labor_workinjury_firstlaw_whitecollar_coverage

This variable = "all" if *labor_workinjury_firstlaw_whitecollar* = *labor_workinjury_firstlaw_whitecollar_fullcoverage*. Otherwise it lists the specific professions and/or industries covered. Open-ended string variable.

labor_workinjury_firstlaw_whitecollar_fullcoverage

First year that all white-collar workers are covered. Excludes military, self-employed and civil servants.

labor_workinjury_firstlaw_bluecollar

First year that any segment of the blue-collar labor force is covered plus the same coding rules for *labor_workinjury_firstlaw*. Excludes military, self-employed and civil servants.

labor_workinjury_firstlaw_bluecollar_coverage

This variable = "all" if *labor_workinjury_firstlaw_bluecollar* = *labor_workinjury_firstins_bluecollar_fullcoverage*. Otherwise it lists the specific professions and/or industries covered. Open-ended string variable.

labor_workinjury_firstins_bluecollar_fullcoverage

The first year of a provident fund or social insurance, consistent with the variable *labor_workinjury_firstins*. We code this as covering "all" as long as all enterprises with at least 5 or more employees are covered.

labor_workinjury_firstsocins_bluecollar_fullcoverage

The first year that all workers as defined by *labor_workinjury_firstins_bluecollar_fullcoverage* have social insurance as defined by *labor_workinjury_first_socins*.

labor_workinjury_firslaw_farmers

First year that any farmers - the owners and managers of agricultural enterprises - are covered.

labor_workinjury_firstlaw_farmers_coverage

Open-ended string variable.

labor_workinjury_firstins_farmers_fullcoverage

Similar to variables with the same label as "..._bluecollar_...", but applicable to the self-employed.

labor_workinjury_firstins_selfemp

Similar to variables with the same label as "..._bluecollar_...", but applicable to the self-employed.

labor_workinjury_firstins_selfemp_coverage

Open-ended string variable.

labor_workinjury_firstins_selfemp_fullcoverage

Similar to variables with the same label as "..._bluecollar_...", but applicable to the self-employed.

labor_workinjury_firstins_agriworkers

Similar to variables with the same label as "..._bluecollar_...", but applicable to non-machine using agricultural workers.

labor_workinjury_firstins_agriworkers_coverage

Open-ended string variable.

labor_workinjury_firstins_agriworkers_fullcoverage

Similar to variables with the same label as "..._bluecollar_...", but applicable to non-machine using agricultural workers.

Country-Specific Notes and Sources

We discuss unique coding rules we used for each country, plus we provide information about the first laws in given countries with respect to blue-collar industrial workers. We list all sources used in our research.

For some countries we list “inferred” as a source. This means we do not have a concrete citation and instead inferred this value based on all available information or a specific citation that suggested but did not directly provide the code. Although we took great pains to identify primary sources for all 186 countries in the GWIP, there are occasions where we could not find or have not yet found a direct reference for a law. In these cases, we infer the data using all available evidence. Sometimes this means we rely on older versions of the SSPW data. For example, in the Federated States of Micronesia we do not have access to the original 1968 work-injury law, thus we cannot deduce that it is an employer liability law or one that involves some type of risk-pooling. However, the SSPW suggests that social insurance first appeared in 1982. As there are no entries in NATLEX, we are left with the inference of the nature of the 1968 law. Future iterations will hopefully procure the primary data to verify this.

Bangladesh cow code: 771

While Bangladesh was part of Pakistan, a provident fund form of insurance was set up in 1962 but only seemed to apply to 'East Pakistan', so not to Bangladesh, therefore we do not code this as a first social insurance law (Andersen et al 1991). Moreover, in the Legislative Series guidebook there are many laws listed under "Bangladesh" but they are Indian laws, and it is unclear that they applied. Therefore we code the first social insurance as 2006 from NATLEX which seems to have compulsory insurance for enterprises with at least 100 workers, so still not full blue collar insurance coverage

Canada

cow code: 20

Federal system, there is no overall national legislation. It is by province. Ontario was the first in 1886 with an employer liability act and then 1914 with a workman's comp act. Nova Scotia (1915), BC (1916), Alberta (1918) and New Brunswick (1918). Prince Edward Island was the last to enact legislation in 1949 (not counting Newfoundland which was not a Canadian province at first). Therefore we could say that there is both the first 'national' law and national coverage starting in this year. However, there was a Federal law in 1918 that covered Federal Railroad employees. As most railroads were public at that time, this meant a large segment of blue-collar workers were covered so we will now code the first law as 1918. The 1918 law was a centralized program, without any employee contributions, and the government was fully responsible. This is not social insurance because there is no insurance agency set up by the government, thus it is coded as a "fund". We code 1949 as the first "social insurance" because all provinces by that year (that existed in that year) had set up workmen's compensation that more or less was social insurance in nature.

<p>Although Czechia and Slovakia only came into existence with their current borders in 1993, we treat Czechoslovakia as a special case. We code the laws of 1918 which were carried over from the Austro-Hungarian system, as the first national laws. Our justification for this is that we are trying to trace the global development of work-injury law and this was a central area for its development. If we only code 1993 as the first 'national law' it presents the data in a way that is terribly misleading. As we do not expect to have both Czechoslovakia and Czechia and Slovakia as separate entities in our database, we make reference to the shared Czech history via this coding.</p> <p>ILO. 1935. The first work injury law is part of a broader social insurance program covering sickness, maternity and employment injury. Coverage of this insurance scheme implies State employees, domestic workers as well as "wage and salary earners employed by agricultural, industrial and commercial undertakings, and all manual and nonmanual employees giving their services to an employer for remuneration under an express or implied contract of employment". This law therefore legally covers all blue collar workers and is coded as such.

ILO LS 1951

Like all French-Indochina colonies, 1936 labor law covered native workers and technically all of them. But in practice very few received anything. Nonetheless we code 1936 as the year of blue-collar full coverage. The 1994 law is sufficiently vague, it seems that workers must contribute to social security but employers have optional contributions to a fund or insurance, thus we only code 1999 as first insurance

Mongolia cow code: 712

Gained independence from China in 1911. The former Mongolian territory includes "Inner Mongolia" which is part of China. The country of Mongolia today is what was formerly "Outer Mongolia" and was a satellite Soviet republic 1924-1992. Repeated searches have not produced any information about Mongolia's socialist period in terms of worker protections. The economy was 'centrally planned' but most of it was pastoral and informal. Unless we encounter more information we can only code labor laws in the post-socialist era. The 1977 book *Social Security Programs throughout the World* states that Mongolia has either no social security program or data are lacking. Thus, we find the first law in 1994. It has compulsory insurance but there are no minimums so it seems like the choice of insurance company would determine the benefits.

Togo cow code: 461

We were unable to locate the original text of the 1973 Social Security (general standards) law that is reported on the ILO's NATLEX database. It appears to be social insurance, but it also appears to include the operation of a fund. We code it as social insurance, consistent with the SSPW coding. Further investigation is necessary to determine if this coding is correct.

United Kingdom cow code: 200

Although many studies cite 1897 as the first “social insurance” law for work-injury, this is false. Upon careful reading of the law there is no compulsory insurance nor provident fund set up. In 1934 a coal miner’s compulsory insurance scheme is introduced, but it is not until Beveridge (1946) that social insurance comes to cover work-injury. Part of the confusion comes because in the UK prior to Beveridge, there was social insurance set up for unemployment and health care and at this time the UK would be classified as having “social insurance” generally speaking.

Packer, Launcelot. 1912. 'History and Operation of Workmen’s Compensation in Great Britain'. 618. Washington D.C.: US Senate. https://phw03.newsbank.com/cache/serial2/display_bitonal_pdf/ra_117675C6332E99A0_1_71.pdf.

United States of America cow code: 2

Federal system. No full coverage federal law, only for blue-collar federal employees. By 1949 it seems that every state had some form of work-injury law but the coverage and provisions vary widely. Work disability compensation was omitted from the 1935 Social Security Act. In 1956 a disability benefit for older workers was introduced, thus marking the first social insurance law. There has not been a comprehensive social insurance law in the United States, each state regulates this on its own and not all employees are covered.

Hackett, Frank Warren. 1908. “The Federal Employers’ Liability Act of 1908: Is It Constitutional?” *Harvard Law Review* 22 (1): 38–47. <https://doi.org/10.2307/1325455>.

Uruguay cow code: 165

In the 1920 law, paragraph 47 reads, “Any employer who has failed to make use of the permission to free himself of the responsibility arising from occupational risks by means of

insurance in accordance with the provisions of this Act, shall deposit with the State Insurance Bank a capital amount corresponding to the pension or pensions due from him, within the ten days following the agreement of the parties before the justice of the peace or the final verdict. The deposition of the said capital amount may be demanded either by the interested person or by the State in pursuance of the judicial proceedings.”

This means that a fund is set up in case of an accident, this is like a provident fund but happens ‘on the fly’, sort of like a fund-as-you-go fund for employers. We code this as a “fund” as it creates a safety net that is much stronger than simple employer liability; although technically not exactly “risk-pooling” because it only impacts employers after an accident. This decision was helped along by the fact that most large employers go through the state insurance company by 1920.
